Chen Sun, *et al*

for

Organizing and Accessing Electronic Business

Cards by Virtual Subdomain

TECHNICAL FIELD OF THE INVENTION

This invention pertains to the arts of computer networks, addressing of computers on computer networks, and the organization and accessing of electronic business cards..

CROSS-REFERENCE TO RELATED APPLICATIONS

(CLAIMING BENEFIT UNDER 35 U.S.C. 120)

This application claims is related to U.S. Application Serial No. 09/476,632 filed by Azkar Choudhry on December 31, 1999 which is commonly assigned with this application.

FEDERALLY SPONSORED RESEARCH AND DEVELOPMENT STATEMENT

This invention was not developed in conjunction with any Federally-sponsored

MICROFICHE APPENDIX

5

U. S. Applications Serial Nos. 09/476,632 and 09/642,127, both filed by Azkar Choudhry on December 31, 1999 and August 18, 2000, respectively, are incorporated herein by reference in their entirety, including drawings and any microfiche appendices, and are hereby made a part of this application.

[illegible]

10

BACKGROUND OF THE INVENTION

The Internet is possibly the greatest advance in information technology since the invention of the Gutenberg movable type printing press. It's impact on society worldwide has truly only been realized to a fraction of its ultimate potential. The Internet is not a
5 single computer network, however, but is a hierarchy of many computer networks, all of which are interconnected by various types of server computers.

Key to success of the Internet is the addressing scheme which was adopted. The addressing scheme allows two types of addressing to be used when one computer transmits data to another computer over the Internet. The first addressing scheme,
10 referred to as the Internet Protocol ("IP") address, is a numeric address value consisting of four binary octets separated by a period or "dot", such as AA.BB.CC.DD. Each of the octets is allowed to range in value from 0 to FF hexadecimal, or to 255 decimal. The values towards the left of the address, such as AA and BB, are referred to as network addresses and are used for coarse resolution of the address, while the values towards the
15 right of the address are used for fine resolution of the address, such as CC and DD.

For example, turning to FIGURE 1, the Internet backbone (1) is a set of high-speed data transmission facilities which interconnect several key switching and routing centers. Domain servers (2 and 6) may connect directly to the backbone (1), or they may connect indirectly to the backbone through other servers and other networks. For
20 example, the domain server (2) on the right serves the subnetwork (4) on the right, which interconnects one or more client computers (5) to each other and to the Internet. Data or

messages to be sent to any of the computers on the right-side network (4) must be properly addressed to be routed to them. For example, the right domain server (2) may be assigned a particular range or set of ranges of IP addresses to serve, such as 155.179.00.XX. A computer on the right-side network (4) may be given an address within this range, such as 155.179.00.213 (in decimal). A second computer on the right-side network (4) may be given an address such as 155.179.00.111. So, the octets towards the right of the IP address are subaddresses of the server's address. This scheme of addressing and subaddressing is well known within the art.

This subaddressing scheme is designed to allow subnetworking as well. For example, as shown in FIGURE 1, the left-side domain server (6) may be assigned an IP address range of 98.99.YY.XX (in decimal). Computers directly connected to its subnetwork (8) would receive addresses within this range, as given in the previous example. However, another subnetwork (11), or sub-subnetwork to be literally correct, may be interconnected to the left-side network (8) via another domain server, which may be referred to as a subdomain server (9). This subdomain server may be given a range of IP addresses within the range of IP addresses for the left-side network domain server (6), such as 98.99.192.XX. The inter-networking scheme of the Internet is built upon this hierarchical structure of networks and addresses.

The use of the term "domain" with respect to addressing actually implies more than the numeric IP addressing just discussed, in Internet parlance. While computers may deal well with numeric values for addressing, human users do not deal well with long

numbers. When the architects of the early versions of the Internet, known as the ARPAnet, considered previous numbering schemes for humans, such as telephone numbers, they recognized this problem. In order to make the Internet more “user-friendly”, a text-based addressing scheme was “overlaid” on top of the numeric IP

5 addressing scheme. Thus, a hierarchy of text-based addresses was defined. At the top of the hierarchy is a domain, which in general a large range of IP addresses or group of addresses. For example, in FIGURE 1, the right-side domain server (2) may be assigned an easy to remember domain name such as “uspto.gov”. Under the Internet domain name convention, the extension of the name following the period or “dot” helps to categorize the type of domain. In this example, “gov” refers to government domains. Coupled with
10 the domain name, “uspto”, a particular domain server is addressed. Other extensions, such as “com” for commercial uses, “edu” for educational institutions and “net” for network services companies, are also available.

In order for messages and data to be actually routed to a computer using a domain
15 name, a translation to a numeric IP address must be made. This is done by a number of distributed “domain name servers” (“DNS”), which can be queried by Internet routers to provide the translation. Each domain server maintains records regarding IP-to-domain name assignments for the domains which it serves. This translation technique and the protocol for updating records is described in the Internet Request For Comment (“RFC”) papers, which are public documents available from InterNIC. Of particular interest are:
20

- a. RFC1033, Domain Administrators Operations Guide

- b. RFC1034, Domain Names - Concepts and Facilities, and
- c. RFC 1035, Domain Name - Implementation and Specification.

These are public documents, and are well known within the art.

Continuing with the analogical structure to numeric IP addressing, domain names

5 may be broken into two types of more resolute addresses. The first type is based upon directory structure of the file system on the server. For example, a subdirectory on the US Patent and Trademark Office's web server which contains general information might be named "gen_info", and could be addressed as "www.uspto.gov/gen_info".

Subnetworks and virtual subnetworks may be addressed by prefixing the general domain

10 name with a subdomain name or names. For example, a subnetwork which serves only the trademark division of the US Patent and Trademark Office may be given the subdomain name "tm", allowing the subdomain server (such as 9 in FIGURE 1) to be addressed as "tm.uspto.gov". The two addressing schemes can be combined, such as "tm.uspto.gov/gen_info", which would access a file named "gen_info.html" located in the

15 root directory of the subdomain server for "tm" under the domain server for "uspto.gov". Alternatively, if a subdirectory called "gen_info" exists on the subdomain server "tm", a file named "index.html" (or any other default file) may be accessed by a web browser which is pointed to this full address.

Virtual subdomains are special cases of subdomains, which may or may not

20 actually refer to a separate physical subdomain server from the domain server, but may refer to a directory or other software facility on the domain server. This is referred to as

“hosting” the subdomain on the domain server. Later, if the owner of the subdomain desires, a separate subnetwork may be established with a separate subdomain server.

Just as paper business cards have been a fundamental tool for exchanging personal contact information between business persons, electronic business cards have become
5 very common to exchange over the internet or via email. Most electronic business card services are free, or nearly free, such as Netscape’s Net Business Center and Net Business Card. Most of these services are co-marketed with other types of advertising and allow for searching of a database to view a business card.

As shown in Figure 4, the current technology uses a CGI form which is sent (40)
10 to a user of a web browser. The user then completes and submits (41) the form back to a web server, which then parses (42) the response data and formulates a database query.

This data base query (43) is then sent to the database (44) which contains registered user business card information. The queried information is returned by the database (44) to the web server which then creates a dynamic web object (45). In this
15 example, the dynamic web object is an electronic business card which is transmitted to the web browser user who then views it (46).

The main problem with this method is that the database query is created dynamically in response to specific information provided by the user in the CGI form. For example, a CGI query on Netscape’s Net Business Card for a business card for a
20 patent attorney would appear as shown below.

Table 1: Example Query to a Database of Electronic Business Cards

http://yp.superpages.com/listings.phtml?SRC=aol&STYPE=S&PG=

5 L&search=Find+It&N=&C=lawyer&T=chicago&S=

Referring to this example query which was posted to AOL's online yellow pages in order to find an electronic business card for a lawyer in Chicago, a CGI query is added to the end of the hyperlink or web address of the web server in this case,
10 "superpages.com". One can see that within the query is buried the string which was supplied in the CGI form by the user, "lawyer" and "Chicago".

Even though this kind of online business card in advertising is useful for some purposes, it is not conveniently accessed through any other means other than the accessing of the CGI form and completing of the CGI form. For example, this string
15 would not be practical to be inserted into an electronic mail message to allow a recipient of an email message to easily access the business card online. Further, as the operator of the online business card data base server may change the database interface, a holder of an online business card in the database may not depend on the query string being unchanging over time.

20 Therefore, there is a need in the art for a more convenient way to access and organize electronic business card via a computer internet such as the Internet, and to

1900	1901	1902	1903	1904	1905	1906	1907	1908	1909	1910	1911	1912	1913	1914	1915	1916	1917	1918	1919	1920	1921	1922	1923	1924	1925	1926	1927	1928	1929	1930	1931	1932	1933	1934	1935	1936	1937	1938	1939	1940	1941	1942	1943	1944	1945	1946	1947	1948	1949	1950	1951	1952	1953	1954	1955	1956	1957	1958	1959	1960	1961	1962	1963	1964	1965	1966	1967	1968	1969	1970	1971	1972	1973	1974	1975	1976	1977	1978	1979	1980	1981	1982	1983	1984	1985	1986	1987	1988	1989	1990	1991	1992	1993	1994	1995	1996	1997	1998	1999	2000	2001	2002	2003	2004	2005	2006	2007	2008	2009	2010	2011	2012	2013	2014	2015	2016	2017	2018	2019	2020	2021	2022	2023	2024	2025	2026	2027	2028	2029	2030	2031	2032	2033	2034	2035	2036	2037	2038	2039	2040	2041	2042	2043	2044	2045	2046	2047	2048	2049	2050	2051	2052	2053	2054	2055	2056	2057	2058	2059	2060	2061	2062	2063	2064	2065	2066	2067	2068	2069	2070	2071	2072	2073	2074	2075	2076	2077	2078	2079	2080	2081	2082	2083	2084	2085	2086	2087	2088	2089	2090	2091	2092	2093	2094	2095	2096	2097	2098	2099	2100	2101	2102	2103	2104	2105	2106	2107	2108	2109	2110	2111	2112	2113	2114	2115	2116	2117	2118	2119	2120	2121	2122	2123	2124	2125	2126	2127	2128	2129	2130	2131	2132	2133	2134	2135	2136	2137	2138	2139	2140	2141	2142	2143	2144	2145	2146	2147	2148	2149	2150	2151	2152	2153	2154	2155	2156	2157	2158	2159	2160	2161	2162	2163	2164	2165	2166	2167	2168	2169	2170	2171	2172	2173	2174	2175	2176	2177	2178	2179	2180	2181	2182	2183	2184	2185	2186	2187	2188	2189	2190	2191	2192	2193	2194	2195	2196	2197	2198	2199	2200	2201	2202	2203	2204	2205	2206	2207	2208	2209	2210	2211	2212	2213	2214	2215	2216	2217	2218	2219	2220	2221	2222	2223	2224	2225	2226	2227	2228	2229	2230	2231	2232	2233	2234	2235	2236	2237	2238	2239	2240	2241	2242	2243	2244	2245	2246	2247	2248	2249	2250	2251	2252	2253	2254	2255	2256	2257	2258	2259	2260	2261	2262	2263	2264	2265	2266	2267	2268	2269	2270	2271	2272	2273	2274	2275	2276	2277	2278	2279	2280	2281	2282	2283	2284	2285	2286	2287	2288	2289	2290	2291	2292	2293	2294	2295	2296	2297	2298	2299	2300	2301	2302	2303	2304	2305	2306	2307	2308</

SUMMARY OF THE INVENTION

The present invention associates a virtual subdomain name with an electronic business card or other home page type information web object, referred to as the "webBIZdex". The webBIZdex is a searchable index of online electronic business cards such as webBIZcards. WebBIZcards are formed by associating with an online business card a virtual subdomain name, such as John.collegealum.edu, instead of a longer CGI database query or a subdirectory name such as collegealum.edu/John. By using a virtual subdomain as the link to access a webBIZcard or other electronic business card online, a user may quickly find and contact desired members or holders of electronic business cards. And, a holder of a webBIZcard may easily insert the virtual subdomain as a hyperlink in any HTML or other web object such as an email message. As the virtual subdomain which is described in the related and incorporated application is a dynamically created and dynamically managed addressing scheme, the webBIZdex itself may actually be a distributed database across multiple servers and may be dynamically reorganized and changed. This further allows the owners or holders of the electronic business cards to easily and quickly update there own personal information within any database which is linked to the virtual or which is associated to the virtual subdomain for his business card.

BRIEF DESCRIPTION OF THE DRAWINGS

The figures presented herein when taken in conjunction with the disclosure form a complete description of the invention, wherein elements and steps indicated by like reference indicators are the same or equivalent elements or steps.

5 FIGURE 1 presents the prior art arrangement of domain servers and subdomain servers in a computer network such as the Internet.

FIGURE 2 shows the general architecture of an Apache HTTP server.

FIGURE 3 depicts the basic communication process and arrangement between an Internet browser computer, an ISP, and domain name server, and a domain server.

10 FIGURE 4 illustrates the method currently in use to organize, search for, and present electronic business cards using database queries.

FIGURE 5 presents in logical flow of the invention to organize, search for, and present electronic business cards using virtual subdomains.

DETAILED DESCRIPTION OF THE INVENTION

The invention is preferably realized using an Apache HTTP (Hyper Text Transfer Protocol) Web Server as the basic platform. The Apache server is well known within the art, and is possibly the most popular web server used today. Many webmasters are
5 capable of configuration and installation of such a server, and they can be readily obtained from companies such as Apache Digital Corporation of Durango, Colorado.

FIGURE 2 shows the well known architecture of an Apache HTTP server. The server is a combination of a computer platform with specialized software. The computer platform generally consists of a central processing unit ("CPU") with memory (21), one
10 or more hard disk drives ("HDD") (22), and a network interface card ("NIC") (23). This may be an IBM-compatible personal computer, as in the preferred embodiment, or Sun workstation or other suitable standard computer platform. A Basic Input/Output System ("BIOS") and set of low level driver firmware modules (24) typically interfaces the
higher-level software to the hardware, including a NIC driver. An multi-tasking
15 operating system ("OS") (25), such as Microsoft Windows NT, Linux, Unix or IBM OS/2, is also installed on the computer platform. Linux is the operating system of the preferred embodiment.

The Apache HTTP server software (27) is available for free download from the Apache Software Foundation at <http://www.apache.org>. It is an application program
20 which interfaces to the Internet (1) through the NIC (23) and a Transmission Control Protocol/Internet Protocol ("TCP/IP") communications protocol stack. The TCP/IP stack

may be native to the OS, or it may be supplied as a separate but compatible module with the Apache application and the OS. Other application programs (26) such as database engines, CGI scripts, Java servlets and PHP scripts may be executed on the same platform simultaneously to the Apache HTTP server application. PHP/FI is a scripting language
5 that supports dynamic HTML pages. It is similar to Apache's SSI, but more complex and has database modules for the most popular databases. PHP/FI is a product of Iquest Internet of Indianapolis, Indiana. In the preferred embodiment, the NIC is a 100BaseT local area network interface card, interconnected to the Internet (1) via one or more routers.

10 FIGURE 3 shows the well known arrangement of Internet browser computers, Domain Name Servers ("DNS"), Internet Service Providers ("ISP"), and domain servers. The internal architecture of domain name servers is fully described in RFC 1035. In general, when a user selects a network address, such as "http://www.anycompany.com", in his web browser software, the browser machine (30) transmits a request (A) to the ISP
15 (34). The ISP (34) then contacts (B) the DNS (32), which returns a translation (C) of the text-based URL to a numerical IP address value. The user's browser then requests (E) a document from the domain server (33) located at the IP address given by the DNS. The domain server (33) transmits (F) the document, typically in HTML, to the browser machine (30) via the ISP.

20 The invention is realized by associating a web server script with a virtual subdomain server. Of course, the script may be co-resident within the same web server

or house or hosted within different web servers. The virtual subdomain server is described in the related application. The virtual subdomain server translates virtual subdomains to other types of Internet addressing schemes such as subdirectory names or other domains and subdomains. As this is done in real time, the virtual subdomain may
5 be repointed to any other destination address as desired dynamically.

Turning to Figure 4, the webBIZdex web server script for providing a searchable index of online business cards transmits (50) to the web browser user a form to collect information on which to find business cards. This form may be sent to the web browser user using a CGI type form or other type form such as a Java form. The user completes
10 the form and submits (51) it to the webBIZdex server.

The form data is received by the web server script and parsed (52) to create a database search query. However, unlike systems of the current technology, this database query string is never visible to or provided to the user. The search query (54) is answered by the database by returning one or more records containing the data requested by the
15 search query including one or more virtual subdomain addresses.

The server script creates (55) a list of available business cards comprised of multiple virtual subdomain entries, such as "john.collegealum.edu", and transmits this list to the web browser user. The web browser user may then simply hyperlink (57) or select any of the virtual subdomains, which will activate the process described in the related
20 application whereby the virtual subdomain server intercepts the request for the unregistered virtual subdomain name and translates it to an actual web address. At this

actual web address may be any web object, such as an electronic business card.

As such, the method of the webBIZdex web server script as shown in Figure 5 has several advantages over the current technology. First, the script or server maintains a centralized database of web business card web objects, including a database of virtual subdomains associated with online business cards. The online business cards themselves (or other web objects) may be distributed among one or many other web servers, and are associated and accessed via the virtual subdomain address. Thus, the "index engine" such as the web server script just described only must return in response to a query a list of available virtual subdomains and does not need to create graphic images.

Secondly, the owner of a web business card may redirect his virtual subdomain to any web source, at any time, dynamically, due to the dynamic nature of the virtual subdomain redirection capabilities. This eliminates the costly expense of maintenance of a large centralized database of electronic business cards.

Thirdly, this method does not stay involved (e.g. "in the loop") with the processing and transmission of the actual online business card web objects after the search is completed, thereby allowing it to process more requests per unit of time than the current technology system which also transmits the electronic business cards.

Fourth, this system and method allows a user of a webBIZcard to include a simple hyperlink, a virtual subdomain, in other web objects such as e-mail messages, to allow other web browser user's to quickly and efficiently access his or her online business card.

While the disclosure contained herein has set forth a preferred embodiment of the

invention, and many of the fundamental components used within the invention are well known within the art, it will be appreciated by those who are skilled in the art that variations to the combination of elements and steps disclosed can be made without departing from the scope and spirit of the invention. Such variations may include, but are

5 not limited to, selection of alternate web server hardware platforms, operating systems, and HTTP server suites, as well as implementation of the process as a servlet or other program embodiment.
